quite simply test driven development is meant to eliminate fear in application development while some fear is healthy often viewed as a conscience that tells programmers to be careful the author believes that byproducts of fear include tentative grumpy and uncommunicative programmers who are unable to absorb constructive criticism when programming teams buy into tdd they immediately see positive results they eliminate the fear involved in their jobs and are better equipped to tackle the difficult challenges that face them tdd eliminates tentative traits it teaches programmers to communicate and it encourages team members to seek out criticism however even the author admits that grumpiness must be worked out individually in short the premise behind tdd is that code should be continually tested and refactored kent beck teaches programmers by example so they can painlessly and dramatically increase the quality of their work

software development for the automotive domain has become the enabling technology for almost all safety critical and comfort functions offered to the customer ninety percent of all innovations in automotive systems are directly or indirectly enabled by embedded software the numbers of serious accidents have declined in recent years despite constantly increasing traffic this is correlated with the introduction of advanced software enabled functionality for driver assistance such as electronic stability control software contributes significantly to the automotive value chain by 2010 it is estimated that software will make up 40% of the value creation of automotive electronics however with the large number of software enabled functions their interactions and the corresponding networking and operating infrastructure come significant complexities both during the automotive systems engineering process and at runtime a central challenge for automotive systems development is the scattering of functionality across multiple subsystems such as electronic control units ecus and the associated networks as an example consider the central locking systems clds whose functionality is spread out over up to 19 different ecus in some luxury cars of course this includes advanced functionality such as seat positioning and radio

tuning according to driver presets upon entry as well as unlocking in case of a detected impact or accident however this example demonstrates that modern automotive systems bridge comfort and safety critical functionality this induces particular demands on safety and security and in general software and systems quality the resulting challenges and opportunities were discussed in depth at the second automotive software workshop san diego aswsd 2006 on whose results we report here
